

Phishing Email Detection & Awareness Report

Email	Indicators	Classification
Sample 1	Fake domain, urgent message, suspicious link	Phishing
Sample 2	Unknown sender, promotional link	Suspicious
Sample 3	Legitimate sender	Safe

Introduction

Phishing is a cyber attack where attackers attempt to steal sensitive information by pretending to be a trusted entity through email communication.

Objective

The objective of this project is to identify phishing indicators and classify emails as Safe, Suspicious, or Phishing.

Tools Used

- Email Samples
- Browser Tools
- GitHub
- MS Word

Common Phishing Indicators

- Spoofed Sender Address
- Fake Domains
- Urgent Language
- Suspicious Links
- Unexpected Attachments
- Requests for Passwords

Prevention Guidelines

- Verify sender addresses.
- Hover over links before clicking.

- Enable MFA.
- Avoid downloading unknown attachments.
- Report suspicious emails.

Phishing Techniques

- Email Spoofing
- URL Manipulation
- Credential Harvesting
- Social Engineering

Real-World Impact of Phishing

- Identity theft
- Financial fraud
- Data breaches
- Malware infections

User Awareness Checklist

- Verify sender address
- Check domain spelling
- Avoid clicking unknown links
- Enable MFA
- Report suspicious emails

Conclusion

This project demonstrated how phishing emails can be detected using common indicators. Users should remain cautious and verify emails before responding.
